

EARLY DETECTION IS CRUCIAL!

Most retinal conditions and other disease can be treated successfully with early detection.

We at Eastside Vision Center use an **Optomap** for ultra-wide digital retinal imaging to help our doctor make informed decisions about your eye health and overall well-being. It provides up to 155% more viewing of your retina over traditional methods.

The **Optomap** can tell if us if you have any conditions in the eyes such as Diabetic Retinopathy, Hypertension Retinopathy, Retinal holes, tears and/or detachments, Macular degeneration, Melanomas and many other retinal disorders. **WE STRONGLY** recommend **ALL** patients to perform this test as part of their comprehensive eye evaluation. It is especially important for patients with family history of diabetes, high blood pressure, retinal diseases and/or other issues that can affect the health of the eye. **There is no dilation done when performing this.**

Optomap is not covered by any insurances and will be a **special fee of \$39.00 extra. No dilation is needed for this.**

Dilation is recommended to do if you chose not to have Optomap done. With dilation you will be experiencing some light sensitivity, blurred vision, wait time may be longer (from 20-25 min), there may be some complications driving and my need a driver. There is **NO addition** fee for this.

I have read the above and would like to proceed with Optomap for \$39.00 **Y / N**

I prefer dilation instead of Optomap at no extra cost **Y / N**
